Oligochaeta (indeterminate)	X	X	X	X	X		

Supplementary Table S1; Sheet 1: Historical records of aquatic invertebrate fauna recorded from the three caves prior to the current study ("X" denotes presence). This includes data for Draenen from Knight et al. (2018), showing taxa recorded predominately in subterranean streams, but also including a few pools, resurgences and ephemeral seepage springs in dolines (sinks) known to connect to the system; for Swildon's from Knight (2011), including sites on the allogenic main stream as well as the four main autogenic tributaries; and for Baker's historical data including the work of Griffiths and Fishpool (1991) and Browne et al. (1970), who sieved stream gravels and collected fauna from pools throughout the cave. Records on the HCRS database for both Swildon's and Baker's are predominately of fauna observed in pools, whereas data on Hazelton are not differentiated and include observations in both streams and pools. As Draenen was discovered after the Hazelton collecting period there are no records for this cave on the database. Continues as Table S1; Sheet 2 on p.S2.

Supplementary Table S2; Sheet 2: Continued and completed from Table S2; Sheet 1 on p.S7.

Full data for DRIP-FED POOL collecting sites within Ogof Draenen. There were no drip-fed pools in the vicinity of Site 4 because the passage below was occupied by a stream. The pools initially present during tray deployment at Site 2 were also within an ephemeral streamway that was flowing during the March 2019 pool sampling visit; thus, no pools were available for sampling at Site 2 on that date.
